Ultra-Low Power, AT Command / API Controlled, Sigfox[®] Compliant Transceiver IC for Up-Link and Down-Link

ON Semiconductor[®]

OVERVIEW

Circuit Description

AX-SFEU and AX-SFEU-API are ultra-low power single chip solutions for a node on the Sigfox network with both up- and down-link functionality. The AX-SFEU chip is delivered fully ready for operation and contains all the necessary firmware to transmit and receive data from the Sigfox network in Europe. It connects to the customer product using a logic level RS232 UART. AT commands are used to send frames and configure radio parameters.

The AX-SFEU-API variant is intended for customers wishing to write their own application software based on the AX-SF-LIB-1-GEVK library.

Features

Functionality and Ecosystem

- Sigfox up-link and down-link functionality controlled by AT commands or API
- The AX-SFEU and AX-SF-API ICs are part of a whole development and product ecosystem available from ON Semiconductor for any Sigfox requirement. Other parts of the ecosystem include
 - ◆ Ready to go development kit DVK-SFEU-[API]-1-GEVK including a 2 year Sigfox subscription
 - ◆ Sigfox Ready[®] certified reference design for the AX-SFEU and AX-SFEU-API ICs
 - ◆ AX-SF10-MINI21-868-B1 and AX-SF10-ANT21-868-B1, Sigfox compliant SMT modules based on AX-SFEU with 50 Ω pads or chip antenna. Not available for AX-SFEU-API

General Features

- QFN40 5 mm x 7 mm package
- Supply range 2.1 – 3.6 V
- –40°C to 85°C
- Temperature sensor
- Supply voltage measurements

- 10 GPIO pins
 - ◆ 4 GPIO pins with selectable voltage measure functionality, differential (1 V or 10 V range) or single ended (1 V range) with 10 bit resolution
 - ◆ 2 GPIO pins with selectable sigma delta DAC output functionality
 - ◆ 2 GPIO pins with selectable output clock
 - ◆ 3 GPIO pins selectable as SPI master interface
 - ◆ Integrated RX/TX switching with differential antenna pins

Power Consumption

- Ultra-low Power Consumption:
 - ◆ Charge required to send a Sigfox OOB packet at 14 dBm output power: 0.28 C
 - ◆ Deep Sleep mode current: 100 nA
 - ◆ Sleep mode current: 1.3 μ A
 - ◆ Standby mode current: 0.5 mA
 - ◆ Continuous radio RX-mode at 869.525 MHz : 10 mA
 - ◆ Continuous radio TX-mode at 868.130 MHz 19 mA @ 0 dBm 49 mA @ 14 dBm

High Performance Narrow-band Sigfox RF Transceiver

- Receiver
 - ◆ Carrier frequency 869.525 MHz
 - ◆ Data-rate 600 bps FSK
 - ◆ Sensitivity –126 dBm @ 600 bps, 869.525 MHz, GFSK
 - ◆ 0 dBm maximum input power
- Transmitter
 - ◆ Carrier frequency 868.13 MHz
 - ◆ Data-rate 100 bps PSK
 - ◆ High efficiency, high linearity integrated power amplifier
 - ◆ Maximum output power 14 dBm
 - ◆ Power level programmable in 1 dBm steps

Applications

Sigfox networks up-link and down-link.

Table 1. PIN FUNCTION DESCRIPTIONS

| Symbol | Pin(s) | Type | Description |
|--------|------------|------|--|
| CLKN | 39 | A | TCXO interface |
| CLKP | 40 | A | TCXO interface |
| GND | Center pad | P | Ground on center pad of QFN, must be connected |

A = analog
 I = digital input signal
 O = digital output signal
 PU = pull-up
 I/O = digital input/output signal
 N = not to be connected
 P = power or ground
 PD = pull-down

All digital inputs are Schmitt trigger inputs, digital input and output levels are LVCMOS/LVTTL compatible. Pins GPIO[3:0] must not be driven above VDD_IO, all other digital inputs are 5 V tolerant. All GPIO pins and UARTRX start up as input with pull-up. For explanations on how to use the GPIO pins, see chapter “AT Commands”.

COMMAND INTERFACE

General Information

The chapter “Command Interface” is a documentation of the AT-Command set for devices which do not have an API-interface. To see whether the device is capable of receiving AT-Commands, please refer to table “Device Versions”. If the device has been shipped with the API-Interface, please refer to the SW manual and “apiexample” code delivered with AX-SF-LIB-1-GEVK for an introduction on how to setup a project and how to use the API-Interface.

Serial Parameters: 9600, 8, N, 1

The AX-SFEU uses the UART (pins UARTTX, UARTRX) to communicate with a host and uses a bitrate of **9600 baud**, no parity, 8 data bits and one stop bit.

Power Modes

Standby

After Power-Up and after finishing a SIGFOX transmission, AX-SFEU enters Standby mode. In Standby mode, AX-SFEU listens on the UART for commands from the host. Also, OOB frames are transmitted whenever the OOB timer fires. To conserve power, the AX-SFEU can be put into Sleep or turned off (Deep Sleep) completely.

Sleep

The command **AT\$P=1** is used to put the AX-SFEU into Sleep mode. In this mode, only the wakeup timer for out-of-band messages is still running. To wake the AX-SFEU up from Sleep mode toggle the serial UARTRX pin, e.g. by sending a break (break is an RS232 framing violation, i.e. at least 10 bit durations low). When an Out of Band (OOB) message is due, AX-SFEU automatically wakes up to transmit the message, and then returns to Sleep mode.

Deep Sleep

In Deep Sleep mode, the AX-SFEU is completely turned off and only draws negligible leakage current. Deep Sleep mode can be activated with **AT\$P=2**. To wake-up from Deep Sleep mode, GPIO9 is pulled to GND.

When using Deep Sleep mode, keep two things in mind: Everything is turned off, timers are not running at all and all settings will be lost (use **AT\$WR** to save settings to flash before entering Deep Sleep mode). Out-of-band messages will therefore not be sent. The pins states are frozen in Deep Sleep mode. The user must ensure that this will not result in condition which would draw a lot of current.

AT Commands

Numerical Syntax

```

hexdigit ::= [0-9A-Fa-f]
hexnum  ::= "0x" hexdigit+
decnum   ::= "0" | [1-9] [0-9]*
octnum   ::= "0" [0-7]+
binnum   ::= "0b" [01]+
bit      ::= [01]
optnum   ::= "-1"
frame    ::= (hexdigit hexdigit)+
uint     ::= hexnum | decnum | octnum | binnum
uint_opt ::= uint | optnum
    
```

Command Syntax

A command starts with ‘AT’ (everything is case sensitive!), continues with the actual command followed by parameters (if any) and ends with any kind of whitespace (space, tab, newline etc.)

If incorrect syntax is detected (“parsing error”) all input is ignored up until the next whitespace character.

Also note that any number can be entered in any format (Hexadecimal, Decimal, Octal and binary) by adding the corresponding prefix (‘0x’, none, ‘0’, ‘0b’). The only exception is the ‘Send Frame’ command (**AT\$SF**) which expects a list of hexadecimal digits without any prefix.

Return Codes

A successful command execution is indicated by sending ‘OK’. If a command returns a value (e.g. by querying a register) only the value is returned.

Examples

Bold text is sent to AX-SFEU.

```
AT$SF=aabb1234
```

```
OK
```

Sends a Sigfox frame containing {0xaa : 0xbb : 0x12 : 0x34} without waiting for a response packet.

```
AT$SF=0011223344,1
```

```
OK
```

```
RX=AA BB CC DD
```

Sends a Sigfox frame containing {0x00 : 0x11 : 0x22 : 0x33 : 0x44} and waits for a response packet and outputs it on the UART.

```
AT$CB=0xAA,1
```

```
OK
```

The ‘CB’ command sends out a continuous pattern of bits, in this case 0xAA = 0b10101010.

AX-SFEU, AX-SFEU-API

AT\$P=1
OK

This transitions the device into sleep mode. Out-of-band transmissions will still be triggered. The UART is powered

down. The device can be woken up by a low level on the UART signal, i.e. by sending break.

Table 10. COMMANDS

| Command | Name | Description | | | | | | | | | | | | |
|----------------------------|-----------------------------------|--|------|-------|-------------|-----------|------------------------|--|------|------|--------------------------------------|-------|------|-----------------------------|
| AT | Dummy Command | Just returns 'OK' and does nothing else. Can be used to check communication. | | | | | | | | | | | | |
| AT\$SB=bit[,bit] | Send Bit | Send a bit status (0 or 1). Optional bit flag indicates if AX-SFEU should receive a downlink frame. | | | | | | | | | | | | |
| AT\$SF=frame[,bit] | Send Frame | Send payload data, 1 to 12 bytes. Optional bit flag indicates if AX-SFEU should receive a downlink frame. | | | | | | | | | | | | |
| AT\$SO | Manually send out of band message | Send the out-of-band message. | | | | | | | | | | | | |
| AT\$TR? | Get the transmit repeat | Returns the number of transmit repeats. Default: 2 | | | | | | | | | | | | |
| AT\$TR=? | Get transmit repeat range | Returns the allowed range of transmit repeats. | | | | | | | | | | | | |
| AT\$TR=uint | Set transmit repeat | Sets the transmit repeat. Note: the TR value is effective only for frame transmission with downlink request (AT\$SF=payload,1). Uplink only transmissions always use transmit repeat = 2. | | | | | | | | | | | | |
| AT\$uint? | Get Register | Query a specific configuration register's value. See Table 11 for a list of registers. | | | | | | | | | | | | |
| AT\$uint=uint | Set Register | Change a configuration register. | | | | | | | | | | | | |
| AT\$uint=? | Get Register Range | Returns the range of allowed register values. | | | | | | | | | | | | |
| AT\$IF=uint | Set TX Frequency | Set the output carrier macro channel for Sigfox frames. | | | | | | | | | | | | |
| AT\$IF? | Get TX Frequency | Get the currently chosen TX frequency. | | | | | | | | | | | | |
| AT\$DR=uint | Set RX Frequency | Set the reception carrier macro channel for Sigfox frames. | | | | | | | | | | | | |
| AT\$DR? | Get RX Frequency | Get the currently chosen RX frequency. | | | | | | | | | | | | |
| AT\$CW=uint,bit[,uint_opt] | Continuous Wave | <p>To run emission tests for Sigfox certification it is necessary to send a continuous wave, i.e. just the base frequency without any modulation. | Command | Name | Description | | | | | | | | | | | | | | | |
|----------------------------|-----------------------------|--|------|-----------------|-------------|---|--------|--------|---|--------|-----------|---|----------|--------|---|----------|-----------|
| AT:ADC Pn[-Pn [(1V 10V)]]? | Get GPIO Pin Analog Voltage | Measure the voltage applied to a GPIO pin. The command also allows measurement of the voltage difference across two GPIO pins. In differential mode, the full scale range may also be specified as 1 V or 10 V. Note however that the pin input voltages must not exceed the range 0..VDD _{IO} . The command returns the result as fraction of the full scale range (1 V if none is specified). The GPIO pins referenced should be initialized to analog mode before issuing this command. | | | | | | | | | | | | | | | |
| AT:SPI[(A B C D)]=bytes | SPI Transaction | <p>This command clocks out <i>bytes</i> on the SPI port. The clock frequency is 312.5 kHz. The command returns the bytes read on MISO during output. Optionally the clocking mode may be specified (default is A):</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Mode</th> <th>Clock Inversion</th> <th>Clock Phase</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>normal</td> <td>normal</td> </tr> <tr> <td>B</td> <td>normal</td> <td>alternate</td> </tr> <tr> <td>C</td> <td>inverted</td> <td>normal</td> </tr> <tr> <td>D</td> <td>inverted</td> <td>alternate</td> </tr> </tbody> </table> <div style="margin-left: 20px;"> </div> <p>Note that SEL, if needed, is not generated by this command, and must instead be driven using standard GPIO commands (AT:Pn=0 1).</p> | Mode | Clock Inversion | Clock Phase | A | normal | normal | B | normal | alternate | C | inverted | normal | D | inverted | alternate |
| Mode | Clock Inversion | Clock Phase | | | | | | | | | | | | | | | |
| A | normal | normal | | | | | | | | | | | | | | | |
| B | normal | alternate | | | | | | | | | | | | | | | |
| C | inverted | normal | | | | | | | | | | | | | | | |
| D | inverted | alternate | | | | | | | | | | | | | | | |
| AT:CLK=freq,reffreq | Set Clock Generator | Output a square wave on the pin(s) set to T mode. The frequency of the square wave is $(\text{freq} / 2^{16}) \times \text{reffreq}$. Possible values for reffreq are 20000000, 10000000, 5000000, 2500000, 1250000, 625000, 312500, 156250. Possible values for freq are 0...65535. | | | | | | | | | | | | | | | |
| AT:CLK=OFF | Turn off Clock Generator | Switch off the clock generator | | | | | | | | | | | | | | | |
| AT:CLK? | Get Clock Generator | Return the settings of the clock generator. Two numbers are returned, freq and reffreq. | | | | | | | | | | | | | | | |
| AT:DAC=value | Set $\Sigma\Delta$ DAC | Output a $\Sigma\Delta$ DAC value on the pin(s) set to T mode. Parameter value may be in the range -32768...32767. The average output voltage is $(1/2 + \text{value} / 2^{17}) \times VDD$. An external low pass filter is needed to get smooth output voltages. The modulation frequency is 20 MHz. A possible low pass filter choice is a simple RC low pass filter with R = 10 k Ω and C = 1 μ F. | | | | | | | | | | | | | | | |
| AT:DAC=OFF | Turn off $\Sigma\Delta$ DAC | Switch off the DAC | | | | | | | | | | | | | | | |
| AT:DAC? | Get $\Sigma\Delta$ DAC | Return the DAC value | | | | | | | | | | | | | | | |

Table 10. COMMANDS

| Command | Name | Description |
|--------------------------------|---|---|
| AT\$TM=mode,config | Activates the Sigfox Testmode | <p>Available test modes:</p> <ol style="list-style-type: none"> 0. TX BPSK Send only BPSK with Synchro Bit + Synchro frame + PN sequence: No hopping centered on the TX_frequency. Config bits 0 to 6 define the number of repetitions. Setting bit 7 to 1 removes the delay between frames. 1. TX Protocol: Tx mode with full protocol with Sigfox key: Send Sigfox protocol frames with initiate downlink flag = True. Config defines the number of repetitions. 2. RX Protocol: This mode tests the complete downlink protocol in Downlink only. Config defines the number of repetitions. 3. RX GFSK: RX mode with known pattern with SB + SF + Pattern on RX_frequency (internal comparison with received frame ↔ known pattern = AA AA B2 27 1F 20 41 84 32 68 C5 BA AE 79 E7 F6 DD 9B. Config defines the RX on time in seconds. 4. RX Sensitivity: Does uplink + downlink frame with Sigfox key and specific timings. This test is specific to SIGFOX's test equipments & softwares. 5. TX Synthesis: Does one uplink frame on each Sigfox channel to measure frequency synthesis step. |
| AT\$PN=mode,rep (Note 3) | Send & Receive PN9 bitstream for BER measurements | <p>Available modes:</p> <p>TX: 0, 1: start sending PN9 bit stream 0, 0: stop sending PN9 bit stream</p> <p>RX: 3, rep: 3 digits BER precision 4, rep: 4 digits BER precision 5, rep: 5 digits BER precision (slow!)</p> <p>Mode = 3–5 receive a PN9 bitstream and decodes it into a BER measurement. Reports BER on UART for each repetition. Rep is the number of measurements performed, valid range is 1–255.</p> |
| AT\$SE | Starts AT\$TM=3,255 indefinitely | Convenience command for sensitivity tests |
| AT\$SL[=frame] | Send local loop | Sends a local loop frame with optional payload of 1 to 12 bytes. Default payload: 0x84, 0x32, 0x68, 0xC5, 0xBA, 0x53, 0xAE, 0x79, 0xE7, 0xF6, 0xDD, 0x9B. |
| AT\$RL | Receive local loop | Starts listening for a local loop. |
| AT\$TP=repetitions (Note 3) | Transient power measurement mode | Used for transmitter transient power measurements. The command switches the transmitter ON and OFF. During ON state (pseudo) random bit pattern is send. Repetitions is the number of performed measurements, acceptable range is 1–255. |

QFN40 Recommended Pad Layout

1. PCB land and solder masking recommendations are shown in Figure 7.

- A = Clearance from PCB thermal pad to solder mask opening, 0.0635 mm minimum
- B = Clearance from edge of PCB thermal pad to PCB land, 0.2 mm minimum
- C = Clearance from PCB land edge to solder mask opening to be as tight as possible to ensure that some solder mask remains between PCB pads.
- D = PCB land length = QFN solder pad length + 0.1 mm
- E = PCB land width = QFN solder pad width + 0.1 mm

Figure 7. PCB Land and Solder Mask Recommendations

2. Thermal vias should be used on the PCB thermal pad (middle ground pad) to improve thermal conductivity from the device to a copper ground plane area on the reverse side of the printed circuit board. The number of vias depends on the package thermal requirements, as determined by thermal simulation or actual testing.
3. Increasing the number of vias through the printed circuit board will improve the thermal conductivity to the reverse side ground plane and external heat sink. In general, adding more metal through the PCB under the IC will improve operational heat transfer, but will require careful attention to uniform heating of the board during assembly.

Assembly Process

Stencil Design & Solder Paste Application

1. Stainless steel stencils are recommended for solder paste application.
2. A stencil thickness of 0.125 – 0.150 mm (5 – 6 mils) is recommended for screening.

3. For the PCB thermal pad, solder paste should be printed on the PCB by designing a stencil with an array of smaller openings that sum to 50% of the QFN exposed pad area. Solder paste should be applied through an array of squares (or circles) as shown in Figure 8.
4. The aperture opening for the signal pads should be between 50–80% of the QFN pad area as shown in Figure 9.
5. Optionally, for better solder paste release, the aperture walls should be trapezoidal and the corners rounded.
6. The fine pitch of the IC leads requires accurate alignment of the stencil and the printed circuit board. The stencil and printed circuit assembly should be aligned to within + 1 mil prior to application of the solder paste.
7. No-clean flux is recommended since flux from underneath the thermal pad will be difficult to clean if water-soluble flux is used.
