

General Description

The ICS85322I is a Dual LVCMOS / LVTTL-to- Differential 2.5V / 3.3V LVPECL translator. The ICS85322I has selectable single ended clock inputs. The single ended clock input accepts LVCMOS or LVTTL input levels and translate them to 2.5V / 3.3V LVPECL levels. The small outline 8-pin SOIC or TSSOP package makes this device ideal for applications where space, high performance and low power are important.

Features

- Two differential 2.5V/3.3V LVPECL outputs
- Selectable CLK0, CLK1 LVCMOS/LVTTL clock inputs
- CLK0 and CLK1 can accepts the following input levels: LVCMOS or LVTTL
- Maximum output frequency: 267MHz
- Part-to-part skew: 250ps (maximum)
- 3.3V operating supply voltage (operating range 3.135V to 3.465V)
- 2.5V operating supply voltage (operating range 2.375V to 2.625V)
- -40°C to 85°C ambient operating temperature
- Lead-free (RoHS 6) packaging

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential output is a low impedance follower output that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 1A* and *1B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 1B. 3.3V LVPECL Output Termination

Termination for 2.5V LVPECL Outputs

Figure 2A and Figure 2B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{CC} - 2V$. For $V_{CC} = 2.5V$, the $V_{CC} - 2V$ is very close to ground

level. The R3 in Figure 2B can be eliminated and the termination is shown in Figure 2C.

Power Considerations

This section provides information on power dissipation and junction temperature for the IDT85322I. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the IDT85322I is the sum of the core power plus the power dissipated at the output(s). The following is the power dissipation for $V_{CC} = 3.3V + 5\% 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated at the outputs.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.465V * 25mA = 86.6mW$
- Power (outputs)_{MAX} = **30mW/Loaded Output pair**
If all outputs are loaded, the total power is $2 * 30mW = 60mW$

Total Power_{MAX} (3.465V, with all outputs switching) = $86.6mW + 60mW = 146.6mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, T_j , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 157°C/W per Table 5 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.147W * 157^\circ C/W = 108.1^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 5. Thermal Resistance θ_{JA} for 8-Lead TSSOP/SOIC

Meters per Second	θ_{JA} by Velocity		
	0	1	2
8-Lead TSSOP	157°C/W	154°C/W	151°C/W
8-Lead SOIC	103°C/W	94°C/W	89°C/W

NOTE: Above θ_{JA} values are the simulation result using JEDEC Standard Multi-Layer Test Board.

3. Calculations and Equations.

The purpose of this section is to calculate the power dissipation at the output(s).

LVPECL output driver circuit and termination are shown in *Figure 3*.

Figure 3. LVPECL Driver Circuit and Termination

To calculate worst case power dissipation at the output(s), use the following equations which assume a 50Ω load, and a termination voltage of $V_{CC} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CC_MAX} - 0.9V$
 $(V_{CC_MAX} - V_{OH_MAX}) = 0.9V$
- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CC_MAX} - 1.7V$
 $(V_{CC_MAX} - V_{OL_MAX}) = 1.7V$

Pd_H is the power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$\begin{aligned} Pd_H &= [(V_{OH_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) \\ &= [(2V - (V_{CC_MAX} - V_{OH_MAX}))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) \\ &= [(2V - 0.9V)/50\Omega] * 0.9V = \mathbf{19.8mW} \end{aligned}$$

$$\begin{aligned} Pd_L &= [(V_{OL_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) \\ &= [(2V - (V_{CC_MAX} - V_{OL_MAX}))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) \\ &= [(2V - 1.7V)/50\Omega] * 1.7V = \mathbf{10.2mW} \end{aligned}$$

Total Power Dissipation per output pair = $Pd_H + Pd_L = \mathbf{30mW}$
